The UK National Cyber Security Center describes penetration testing as: "A method for gaining assurance in the security of an IT system by attempting to breach some or all of that system's security, using the same tools and techniques as an adversary might."

The goals of a penetration test vary depending on the type of approved activity for any given engagement, with the primary goal focused on finding vulnerabilities that could be exploited by a nefarious actor, and informing the client of those vulnerabilities along with recommended mitigation strategies.

A penetration test is like a secret agent infiltrating an organization to assess its security. Just like how the agent goes undercover to uncover weaknesses and strengths, a penetration test involves a simulated cyberattack on a computer system to evaluate its security. The agent's goal is to identify any vulnerabilities that could be exploited by enemies, just like the goal of a penetration test is to find weaknesses that unauthorized parties could use to gain access to the system's features and data. The agent reports their findings to the organization, just like how the penetration test reports the uncovered security issues and suggests countermeasures to reduce the risk.

A penetration test is like World War II, where different nations engaged in simulated attacks to evaluate their military strength and vulnerabilities. Just like a penetration test, the goal of World War II was to identify weaknesses in defense systems and assess the risks involved.

In World War II, countries like the United States, United Kingdom, and Germany analyzed their opponents' military capabilities and strategies. They conducted reconnaissance missions, gathering information about the enemy's strengths and weaknesses. Similarly, in a penetration test, the tester identifies the target system, collects available... [Show More](#)
